PROJECT TITLE:
LanguageBoost – SDG-4

NAME :
MUHAMMAD ARIF BIN MOHD SAYUTI

MATRIC NUMBER:
A212014

TTTM2213
MOBILE APP DEVOLEPMENT

Problem Statement:

Problem : The primary challenge in modern digital learning is the high rate of learner attrition caused by traditional content delivery that feels boring and overwhelming. Without clear daily objectives, real-time feedback, or social interaction, students often lose the drive to complete their educational goals, directly impacting the global objective of providing quality education for all (SDG 4).

Solution : This project addresses these issues by replacing stagnant learning models with a gamified mobile application. By integrating daily time based goals, and a social 'Friend' system, the app solves the problem of student disengagement and creates a motivated community of learners.

Peer Review Report:

Peer Review Report: MUHAMMAD ADIB NURMAN BIN ZAIDI SHAM (A212263)

The application demonstrates a high level of UI/UX consistency by effectively utilizing Material Design 3 components, such as The use of a vertical gradient background provides a modern aesthetic. The navigation flow is logical and smooth, transitioning effectively from a daily goal-setting entry point to the main learning environment. The implementation of NavHost and rememberNavController ensures that transitions between the home page, profile, and friend list are seamless.

The technical implementation of the AppViewModel is excellent, as it successfully creates a "single source of truth" for the application's data. By using StateFlow and collectAsState(), the UI reacts instantly to changes, such as updating the total score and time goals across different screens. By combining these robust coding practices with a focus on daily goals and social interaction, the project provides a meaningful contribution to SDG 4: Quality Education by making learning both accessible and engaging for all students.
